• Update:

Most of the convection associated with is located to the north of the northern array, with a SW-NE oriented rainband (scattered convection, not much stratiform rain) occurring from west of the southern array to about midway between Gan and Male. Also, some convection is occurring east of the arrays.

Day 1 forecast updated to have a larger area of scattered convection west of the array and a smaller area of organized convection near the Equator. Also, scattered convection east of the southern array and a larger area of organized convection east of the northern array. Forecast schematics zoomed into the DYNAMO arrays are in slide 2.
